ASSEMBLY MANUAL FOR

**** ANUTA **** v3 Wi-Fi

CLOCK

Be very careful with static electricity. If clock not work after build its mean that it can been damaged by static electricity in process of assemble.

Check resistance between +3.3 and GND pins of XS4. The resistance should be more than 1kOhm.

1) You have a PCB with all SMD elements soldered:

2) Place all resistors vertical.

3) Place diodes:

4) Place all ceramic capacitors:

5) Place all electrolytic capacitors. Be careful with polarity!

6) Install SMD inductors:

7) Place all transistors:

8) Install temperature sensor on bottom side of PCB:

9) Install power plug:

10) Install optocouplers:

11) Install IR-sensor:

12) Install buttons:

13) Place battery holder and insert battery when clock will be fully assembled:

14) Place buzzer and be careful with polarity:

15) Install LEDs:

16) Install photoresistor. The high should be equal high of buttons:

17) Install female sockets of Wi-Fi module:

Now you have fully assembled PCB but without tubes:

18) Prepare the IVLM tubes. The numeration start from most long wire and go in clockwise. Longest pin – the first pin.

19) Insert tube into holes in PCB. Hole for first tube pin marked as "1":

20) Use wooden piece for align and solder tubes. Fit the screws like on photo:

Then, fit wooden piece to clock:

21) Now, align tubes like on photo:

22) Insert Wi-Fi model into socket:

23) Then check the resistance between GND and +3.3V pins of XS4 again. It should be more than $\sim 1k$.

24) Plug 12V DC adapter. The microcontroller starts work and you will hear short melody. Tubes will lit. If it not happens, check voltage +3.3V on XS4 between GND and +3.3 pins.

25) After all clock should work.

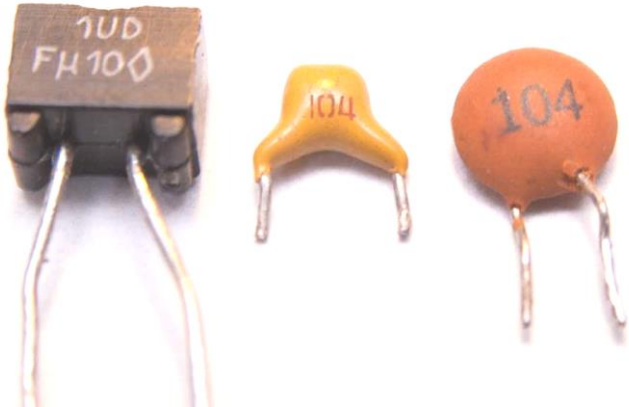

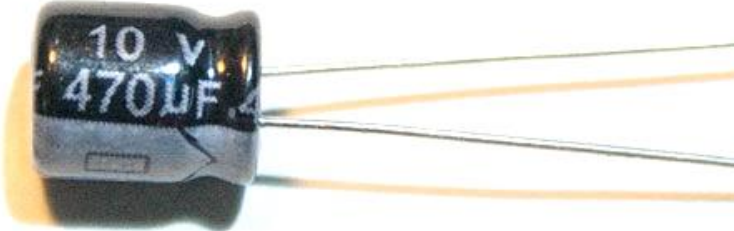

CONGRATULATIONS!

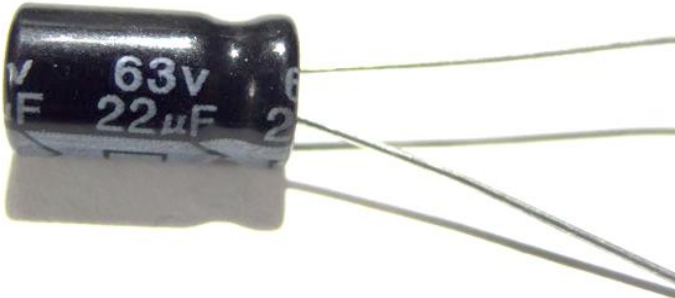

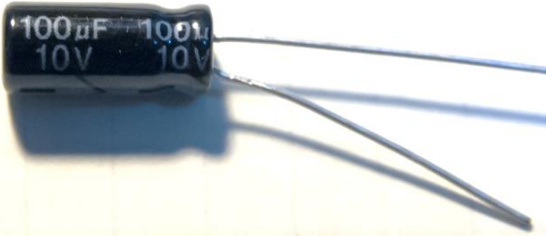

PARTS LIST

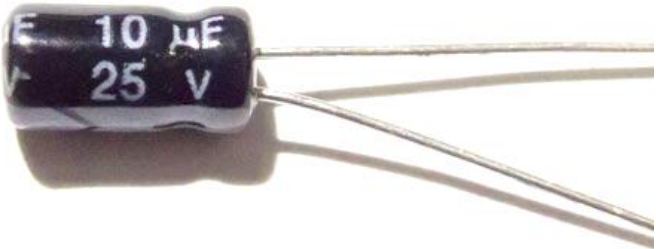

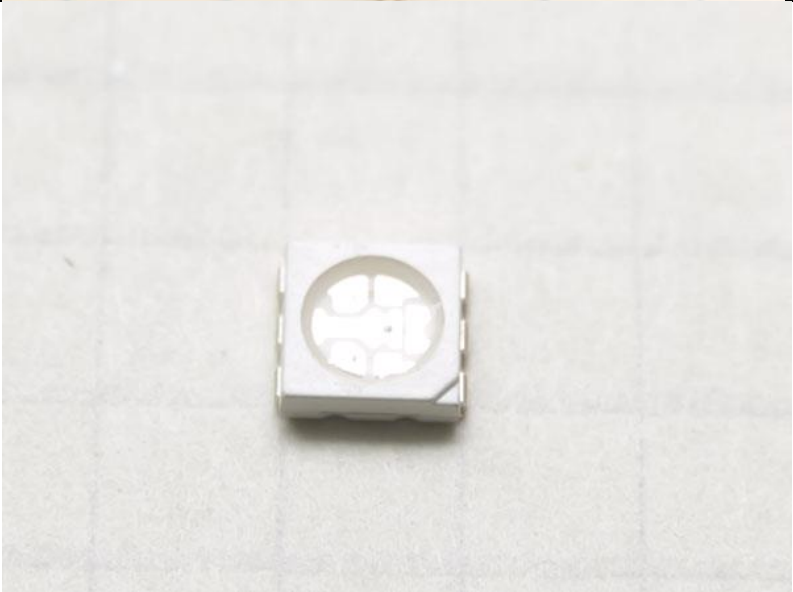

Please note, that elements in kit can be a little different. If you doubt value of element, check it with multimeter.

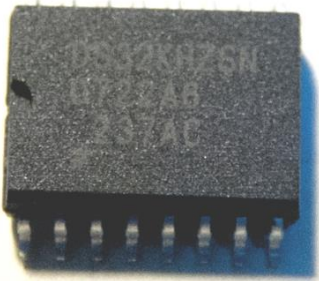

IF VALUE OF ELEMENT IN SPECIFICATION AND ON PCB IS DEFFERENT, PLEASE USE VALUES FROM SPECIFICATION AND SCHEMATIC.
